The inflammatory or allergic disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The method can be used to down-regulate APC-mediated lymphocyte proliferation in mammalian hosts suffering from auto-immune or immune-related disorders, immune system rejection subsequent to tissue or organ transplantation, or inflammatory or allergic diseases. The auto-immune or immune related disorders include multiple sclerosis, rheumatoid arthritis, insulin dependent diabetes mellitus, celiac disease, Sjogren's syndrome, systemic lupus erythematosus, auto-immune thyroiditis, idiopathic thrombocytopenic purpura, hemolytic anemia, orange's disease, Addison disease, autoimmune orchitis, pernicious
                                                                                                                        hypotensive; immunosuppressive; antiparasitic; gastrointestinal inflanmation; therapy.
                                                                                                                                                                                                                                       Zonulin;
                                                                                                                                                                                                                                                                           Peptide antagonist of conulin.
                                                                                                                                                                                                                                                                                                                      05-JUN-2000 (first entry)
                                                                                                                                                                                                                                                                                                                                                                    Y79119;
                                                                                                                                                                                                                                                                                                                                                                                                          Y79119 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  or disorder is selected from asthma, psoriasis, eczematous dermati Karposi's sarcoma, multiple sclerosis, inflammatory bowel disease, proliferative disorders of smooth muscle cells, and inflammatory conditions associated with mycotic, viral, parasitic, or bacterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The method comprises administering to the host an effective amount of a Zot-related immunoregulator selected from Zot (zonula occludens toxin) (zonulin, the amount effective to down-regulate the activity of the APC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a peptide antagonist of zonula occlude toxin (zot) polypeptide. The specification describes a method of suppressing antigen presenting cell (APC)-mediated lymphocyte proliferation in a mammalian host pre-exposed to a particular antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Example 7; Page 59; 95pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Suppression of antigen presenting cell mediated lymphocyte proliferation, by administering a Zot-related immunoregulator useful for treating immune-related disorders, immune system rejection subsequent to tissue or organ transplantation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC (TJ). The peptide antagonists are based on a common motif of ZOT CC and human zonulins, which is believed to be critical for receptor CC binding. They can be prepared by chemical synthesis or by use of CC recombinant DNA techniques. The peptide antagonists are used as an antiinflammatory agents in the treatment of gastrointestinal CC inflammation, where they bind to the ZOT receptor in the intestine CC and yet does not physiologically modulate the opening of TJ in the CC intestine. Gastrointestinal inflammation conditions give rise to concreased intestinal permeability and the peptide is useful for CC treating intestinal conditions that cause protein losing enteropathy CC caused by infection, e.g. Clostridium difficile infection, caused by infection, e.g. congenital gastroenteritis, parasite infestation, bacterial overgrowth, whipple's disease, diseases with CC mucosal erosion or ulcerations, e.g. gastritis, gastric cancer, CC collagenous colitis, inflammatory bowel disease, diseases marked by lymphatic obstruction, e.g. congenital intestinal lymphanglectasia, CC correction of congenital heart disease with Fontan's operation, CC mucosal diseases without ulceration, e.g. meneritar's disease.

They can be used corrections of intestinal and nasal mucosa and across tight junctions of intestinal and nasal mucosa and across tight junctions of intestinal and nasal mucosa and across tight junctions of the blood brain barrier. Zonulin can be used with agents such as drugs, ce.g. lidocaine, adenosine, dobutamine, dopamine, epinephrine, nalbuphine, correspinephrine, naloxone, ketorolac, midazolam, propofol, metacurine, ce mivacurium, succinyicholine, cytarabine, mitomycin doxorubicin, covincristine, vinbiastine, methicillin, mezlocillin, piperacillin, cc vincristine, vinbiastine, methicillin, mezlocillin, piperacillin, cc testosterone, nandrolene, menotropins, insulin, urofolitropin, ce testosterone and interferon-beta, interferon-gamma, interleukin-1 (IL-1), IL-2, IL-4, IL-8, polyvalent IgG, specific IgG, IgA, or IgM. CC the protecins can also be used for the production of antibodies which can be used to assay for zonulin in body tissue or fluids, or in affinity-concertian of zonulin. The present sequence represents an N-terminal concertion of antibodies which can be used to assay for zonulin in body tissue or fluids, or in affinity-concertian of zonulin.

30-SEP-1993;
08-OCT-1993;
Primers JO2, JO3, JO4, JO14 and VH1BACK (Q62765-Q62769) were all used to prepare cDNAs that encode the BrE-3 mouse Ig variable domains. The amplified '7-regions lacked constant regions so as to produce less immunogenia polypeptides. A hybrid polypeptide was prepared using human constant regions with the murine V regions.
                                                                                                                       New analogue peptide(s) comprising antibody variable regions used to develop prods. For use in the detection, diagnosis, therapy and prevention of neoplasms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          used to prepare cDNAs that encode the BrE-3 mouse Ig variable domains. The amplified V-regions lacked constant regions so as to produce less immuogenic polypeptides. A hybrid polypeptide was prepared using human constant regions with the murine V regions. The chimeric polypeptide retained the binding affinity of BrE-3 for human milk fat globule. The manno acid sequences deduced from the amplified VL and VH regions were compared to N-terminal sequences which had been determined directly (i.e. 85274 and R5275). The general agreement between the predicted and the determined amino acid sequences that the cloned cDNAs encode BrE-3.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       3888888888
                       This present sequence is that of a peptide antagonist of zonulin (2), one of 25 such peptides (see Y79105-29) of the invention, which bind to a zonula occludens toxin (ZOT) receptor, yet do not physiologically modulate the opening of mammalian tight junctions (TJ). The peptide antagonists are based on a common motif of ZOT and human zonulins, which is believed to be critical for receptor binding. They can be prepared by chemical synthesis or by use of recombinant DNA techniques. The peptide antagonists are used as an antiinflammatory agents in the treatment of gastrointestinal inflammation, where they bind to the ZOT receptor in the intestine and yet does not physiologically modulate the opening of TJ in the intestine. Gastrointestinal inflammation conditions give rise to increased intestinal permeability and the peptide is useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      mucosal erosion or ulcerations, e.g. gastritis, gastric cancer, collagenous colitis, inflammatory bowel disease, diseases marked by lymphatic obstruction, e.g. congenital intestinal lymphangiectasia, sarcoidosis lymphoma, mesenteric tuberculosis, and after surgical correction of congenital heart disease with Fontan's operation, mucosal diseases without ulceration, e.g. Memetrier's disease, coeliac disease, eosinophilic gastroenteritis, and immune diseases.
This invention relates to a new human antibody specific for human interleukin-12 (IL-12). The invention also includes antigen binding portions that bind to IL-12. Sequences B39485-B39516 represent human anti-IL-12 antibody heavy and light chain complementarity determining region (CDR) amino acid sequences, and also includes variable region amino acid sequences. Other variable region amino acid sequences of the variable region amino acid sequences of the variable region amino acid sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           complementarity determining region; CDR; antirheumatic; antias antisclerotic; neuroprotective; antipsoriatic; antiasthmatic; antiparasitic; antibacterial; immunosuppressive; Crohn's disea

Protein sequences (R66295-51) are novel human immunoglobulin heavy chain sequences encoded by novel isolated genes. The genes (Q78939-79002) were isolated and cloned from a series of cosmid constructs: Y202; Y103; Y21; Y6;Y24; 3-31; M84; M118 and M131, by PCR amplification using primers Q78917-38. The genes are subdivided into 5 families of Vh genes. The fragments cover a region of 800 kb. The DNA fragments were isolated from high molecular weight DNA from human placenta. The DNA was partially digested with TaqI restriction enzyme. The fragments were separated by gel elecrophoresis and 35-45 kb fractions were collected. The fragments were ligated with ClaI-digested cosmid vector pJB81. The ligation products were in vitro packed and infected into E.coli 490A. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          and has antirheumatic; antiarthritic; antisclerotic; antiinflammatory; neuroprotective; antipsoriatic; antiasthmatic; cardiant; antiparasitic; antibacterial and immunosuppressive districtivity. The antibodies or antipen-binding fragments are useful in the treatment of disorders associated with detrimental release of human IL-12, especially Crohn's disease, multiple sclerosis and rheumatoid arthritis. They can also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  represent anti-IL-12 CDR3 related amino acid sequences, B39772-B40063 represent other CDR sequences. Light chain CDR3 consensus sequences are given in B40064-B40067. Primers used in the identification and construction of the antibodies of the invention are given in C61062-C61071. The antibody of the invention is a neutralising antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ното

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      sequences encoded by novel isolated genes. The genes (Q78939-79002) were isolated and cloned from a series of cosmid constructs: Y202; Y103; Y21; Y6;Y24; 3-31; M84; M118 and M131, by PCR amplification using primers Q78917-38. The genes are subdivided into 5 families of Vh genes. The fragments cover a region of 800 kb. The DNA fragments were isolated from high molecular weight DNA from human placenta. The DNA was partially digested with Tag1 restriction enzyme. The fragments were separated by gel elecrophoresis and 35-45 kb fractions were collected. The fragments were invitro packed and infected into E.coli 490A. The fragments were then subcloned by colony hybridisation. The Vh genes and the DNA fragments encoding them are useful in producing human

                                                                                                                             This sequence represents the VH chain of the antibody produced by hybridoma cell line 15D3. It is part of the nucleic acid of the invention which encodes a single-chain antibody molecule (scFv) comprising the heavy-chain complementarity-determining regions (CDRs) of the monoclonal antibody produced by hybridoma cell line 15D3, where the monoclonal antibody and scFv are capable of binding to multidrug-resistant (MDR) human tumour cells. The CDR sequences from both the heavy and light chains (HCDR1, HCDR2, HCDR3, LCDR1, LCDR2, and LCDR3) are all used in an expression cassette that can be used in a method for inducing the production of a polypeptide. The method is useful for producing recombinant scFv, which can be used for diagnosis or therapy (e.g. in the form of an immunotoxin) for MDR tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                 07-JUN-1995;

This sequence is the antibody 15D3 VH chain. The invention relates CC to isolated nucleic acid molecules comprising complementarity determining CC regions (CDRs) and framework regions (FRs) from humans and mice encoding CC amonomeric polypeptide that exhibits the immunological binding CC displaying the multiple drug resistance (MDR) phenotype. The recombinant CC nucleotide sequences can be used to transfect mammalian cells for the CC expression of recombinant human antibodies which exhibit the antigen CC specificity of the murine antibody molecule. The polypeptides produced CC can be used in specific binding assays, affinity purification schemes, drug or toxin targetting, imaging and genetic or immunological consists of that target human cancer cells expressing the MDR phenotype for gene therapy. The recombinantly venecred murine antigen binding sites consist of the selective replacement of FR residues from a rodent light or heavy chain V region with human FR residues to provide a xenogeneic molecule comprising an antigen binding site which retains substantially CC all of the native FR polypeptide folding structure. The nucleic acids cencode molecules with altered or enhanced antigen-binding capabilities and/or reduced immunogenicity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              07-JUN-1995;

                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents the heavy chain of the antibody produced by the hybridoma 15D3. The protein is an example of a monomeric polypeptide of the invention that binds to a human tumour cell displaying multiple drug resistance. The polypeptides are used in specific binding assays, affinity purification, drug or toxin targeting, imaging or immunotherapy of various cancers.

                                                                                                                                                                                        The amino acid sequence (W00240) of the heavy chain variable region (VY) of the epidermal growth factor receptor (EGF-R)-specific mouse-human chimeric antibody chmints was deduced from a cDNA clone (T33445) obtd. by PCR amplification of murine Mint5 hybridoma DSM ACC2150 cDNA. chMint5 comprises Mint5 VH and VL regions fused to human C-gammal and CK regions. Constructs were expressed in CHO cell transfectants. chMint5 shows lower immunogenicity than Mint5 when administered to humans. It can be used in diagnostic assays or used to produce immunotoxins or immunocytokines useful
                                                                                                                                             Sequence
